

Tonbridge

130m² GRP Flat Roof

CASE STUDY

We recently completed a GRP roofing installation for a newly constructed residential development in Tonbridge. The carpenters on site were seeking a reliable, modern solution to cover 130m² of flat roof area.

Problem

As part of the installation, we incorporated expansion joints to accommodate thermal movement and ensure long-term flexibility across the roof structure. Our team carried out the works with precision, ensuring the substrate was fully prepared and the system applied to specification. The result was a sleek, watertight surface with excellent durability and long-term protection.

Installation

This project showcased the efficiency and quality of our GRP roofing systems for new-build applications.

Feedback

Solution

After an initial site visit and consultation, we finalised our quotation and mobilised quickly to meet the build schedule. The ResTec 2020 GRP Flat Roofing system was selected for its proven performance and seamless finish.

Completion

The tradesmen were genuinely impressed by the transformation and the robustness of the finish.
